EFFICIENCY OF A NEW MICROCELL SYSTEM

the

by

W. C. Y. LEE
PacTel Corporation
Walnut Creek, California

I. Introduction

A conventional Microcell uses the cell splitting technique to reduce the size of the cell in order to increase the capacity. In general, when the new cell radius is one half of the old cell radius, the old cell can fit four new small cells. Each small cell would carry the same capacity as the old cell. Then the same areas of the old cell can increase the capacity four times that of the old one. This increases the system capacity. The measured system capacity is the number of channels per square miles or square kilometers. However, when the cell becomes small, the four times of capacity increase will not be observed. This is due to the fact that the interference is harder to control in small cells then in larger cells. When a cell radius is less than 1 kilometer, the cell splitting may only increase system capacity by two times. The radius capacity, m, is defined as the number of cahnnels per cell expressed as follows:

$$m = \frac{M}{K} \qquad \text{number of channels / cell}$$

where M is the total channels and K is the frequency reuse factor. m is inversely proportional to K. m is a fixed number depending on which specified radio equipment is deployed in the cellular system. The size reduction of a cell does not change the radio capacity. In today's analog cellular system, an accepted voice quality has to be maintained by engineering the frequency reuse factor K = 7, i.e., the co-channel cell separation D = 4.6R, or the carrier-to-interference ratio, C/I, $(C/I)_t$ = 18 dB. In this paper a new Microcell system can be implemented for increasing not only system capacity but also radio capacity.

II. A New Microcell System Design

A Microcell is divided into three (can be more than three) submicrocells which are also called zones. In each zone there is a zone site at which the antenna and the radios are installed. The zone site can be located at the center of each zone (see Fig. 1) or at one edge of each zone (see Fig. 2). When a vehicle is at one of the three zones, all three zones receivers receive the signal strengths from the vehicle transmitter. After comparing the signal strengths, the zone transmitter which site receives the strongest strength is turned on to serve the mobile. When the vehicle is moving to another zone, the new zone transmitter is turned on and the old zone transmitter is turned off. The same frequency is used by the vehicle. Therefore, no handoff action is taken by the MTSO. There is only one zone transmitter turned on but all three zone receivers are turned on for any one frequency which is associated with a vehicle. A Microcell may handle 60 frequencies assigned to 60 vehicles. In average, each zone may handle 20 mobile calls associated with 20 frequencies.

III. Efficiency of the New Microcell System

The new Microcell System can be implemented in three different approaches.

A. Selective Omni-zone Approach

We may place a zone site at the center of each zone as shown in Fig. 1. The transmit power of each zone site would be center excited. In this case, we can

calculate theC/I ratio from the new system shown in Fig. 3. The separation D_1 of any two nearest co-channel zones (worst case scenario) in two corresponding microcells is $4.6R_1$. Where R_1 is the zone radius, this separation proves the voice quality of the new Microcell is better than that of the regular analog system. The C/I ratio of a worst case scenario is also calculated. In this scenario, the co-channel vehicles operate in their zones of corresponding cells are within the circle shown in Fig. 3. The interfering zones are identified by A-zones and three B-zones. The serving zone is in the center cell and is indicated by R_1. Then

$$C/I = \frac{R_1^{-4}}{\sum_{i=1}^{6} D_i^{-4}} = \frac{R_1^{-4}}{\underbrace{3(4.6R_1)^{-4}}_{A\text{-zones}} + \underbrace{3(5.75R_1)^{-4}}_{B\text{-zones}}} = 105\,(=)\,20\,dB$$

indicates that even in a worst case scenario of this Microcell system, the C/I is 2 dB better than the regular analog system. Also in Fig. 3, we can show that the separation of co-channel cells is D = 3R where R is the cell radius. Since

$$K \triangleq \frac{(D/R)^2}{3} = 3$$

the new Microcell system proves the increase of radio capacity as K = 7 for a regular cell system to K = 3 for this microcell system which increases 7/3 or 2.33 times. K = 3 is the smallest number in a cellular system regardless of whether it is an analog or digital system except for a CDMA system in which K approaches one. This omni-zone approach provides a superior voice quality in the K = 3 system. However, it is costly to find three center locations of three zones. Also in reality, the control of the transmitted power in omni-zones is difficult. Therefore, the next approach is stated below.

B. Selected Edge-excited Zone Approach

In an edge excited zone approach, all the zone sites are moved from the center of the zones to the edges of the zones, and are also located on the perimeter of the cell boundary as shown in Fig. 2. The calculation of C/I in this edge-excited zone approach is based on the K = 3 configuration shown in Fig. 4. The center cell is the serving cell. One selected zone is serving the mobile call. The center of the cell is the weak spot for receiving the signal from the zone site. There are six interfering cells around the serving cell. Amongst the six interfering cells, three of which may have two zone sites in each cell to interfer with the mobile call in the center cell. The other three cells may have only one zone site in each cell to interfer with the mobile call. Since only one zone site is turned on at a time in a cell on any one frequency, the probability of interfering with the mobile call from each interfering zone site is one third. The distance from each interfering zone site to the vehicle can be obtained from Fig. 4. Three interfering cells, each of which has two C-zones which may interfer with the mobile call. However, the probability is only two-thirds. The probability that the remaining three interfering cells, each having one D-zone which may interfer with the mobile call is one-third. The C/I ratio is obtained at the vehicle from six co-channel cells (denoted"1") as

$$C/I = \frac{R^{-4}}{\underbrace{3\left[\frac{2}{3}(3.6R)^{-4}\right]}_{C\text{-zones}} + \underbrace{3\left[\frac{1}{3}(4R)^{-4}\right]}_{D\text{-zones}}}$$

$$= 63\,(=)\,18\,dB$$

In this edge-excited zone approach, the C/I can still be maintained at 18 dB which is the level for acceptable voice quality. Of course, the K = 3 configuration shown in Fig. 4 proves the increase of radio capacity. As we know, the onmi-zone approach still provides the best voice quality. There is another approach stated in the following section.

C. Non-Selective Edge-excited Approach

There are situations when all the zones have to be turned on. We call this a non-selective edge-excited zone configuration. In a non-selective edge-excited zone configuration, all the cells are treated as omni-cells because all zones sites are transmitting concurrently. In an analog system, the regular center-excited omni-cells require the co-channel interference reduction factor qwhich is equivalent to q = D/R = 4.6 as mentioned previously.

In edge-excited zone cells, the D_1/R_1 has to be 4.6 in order to maintain the voice quality. Where D_1 is the channel zone separation and R_1 is the distance from the zone transmitter to the zone boundary, R_1 is also equal to the cell radius. Then new q ($q = D/R_1$) becomes 3.6 as shown in Fig. 5. Then the frequency reuse factor K becomes

$$K = \frac{(q)^2}{3} = \frac{(3.6)^2}{3} = 4.32 \approx 4$$

which proves that the edge-excited approach can increase the radio capacity by 7/4 = 1.75 times.

IV. Summary

The radio capacity can be increased by 2.33 times if a selective zone approach is used. The radio capacity can be increased by 1.75 times if a non-selective zone appraoch is used. The efficiency of using this Microcell configuration reaches a maximum because K = 3 is the smallest number in a frequency reuse system. When applying the analog system with a non-selective zone configuration, the radio capacity can be increased by 1.75 times. When applying microcells to CDMA systems, the non-selective-zone configuration can be used to further reduce the interference. The attributes of Microcell have been stated in Referene 4.

Personal Telephone CT2/CAI Compatible

The Personal Communications Gateway

CT2...the new, advanced second generation digital cordless telephony. Bringing a family of products that provides freedom in communications, CT2 technology offers the user superior audio quality, a more secure means of communications, and, for the first time, a personal cordless telephone system capable of multiple environment use.

In today's highly mobile society, personal communications are a must. Personal means pocketable. And Motorola delivers the pocketable **SILVERLINK 2000** ...a small, light yet durable personal cordless telephone.

KEY FEATURES

- Pocket Size
- CAI Compatible
- Access Up To 4 Service Providers
- Access Up To 8 Personal Bases
- Memory Storage and Dialing
- Last Number Redial
- Adjustable Ringer Volume
- Adjustable Speaker Volume
- Keypad Lock
- Choice of Primary or Rechargeable Battery

SILVERLINK Telepoint Base Station

Performance Specifications – All specifications comply with CAI (MPT1375) and all standards therein.

Telepoint Base Station
CT2/CAI Compatible

CT2...the new, advanced second generation digital cordless telephony. Bringing a new family of products that provides freedom in communications, CT2 technology offers the user superior audio quality, a more secure means of communications, and a personal cordless telephone capable of multiple environment use.

The public base station connects to the PSTN and provides subscribers with a low cost telephony service. Motorola's base station is designed for maximum operator flexibility: expandable from two to six telephone lines, a cabinet for indoor and outdoor applications, a variety of antenna choices, and modular architecture.

KEY FEATURES:

- CAI Compatible
- 100% Continuous Duty Transmitter
- Excellent Speech Quality
- Time Division Duplex Operation
- Microprocessor Control
- Expandable Database
- Modular Design
- Built-in Diagnostics
- Memory Protection
- Auto Download / Upload of Data
- Secure Algorithm Protection
- Indoor / Outdoor Design
- Secure Cabinet

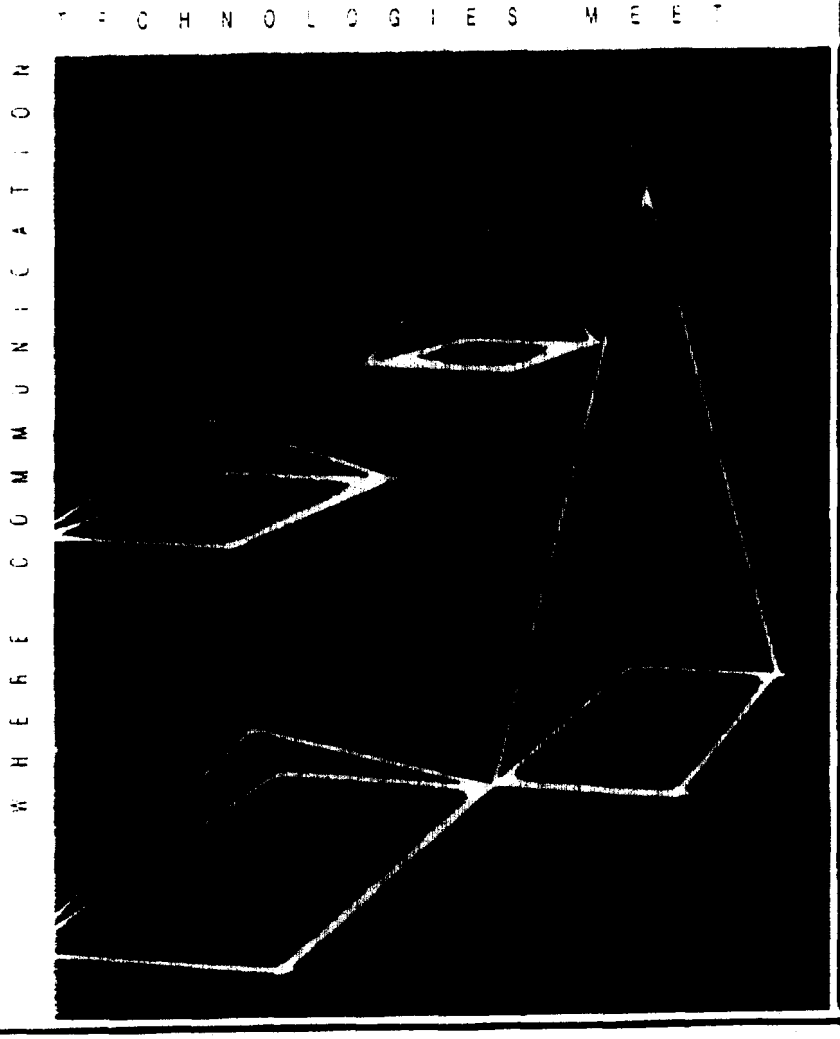
MicroFill™

Structure Specific Coverage

Decibel
Multi
Media
Microcell
Systems



Improve In-Building Coverage And Add Cellular Subscribers.

Anyone who uses hand-held cellular phones understands the frustration of dropped calls and poor or scratchy voice quality. Equally annoying is the inability to make calls inside buildings, subway stations, pedestrian tunnels and other covered structures—particularly when these are often the very places from which calls need to be made.

Fortunately, there's a solution: MicroFill from Decibel Products, an RF distribution system specifically designed to provide basic service or microcellular coverage inside buildings, tunnels and other such structures.

Provide Clean, Clear Signals With Reduced Interference.

Currently, cellular coverage inside buildings and other structures is provided by radiating a signal from a nearby cell site that is strong enough to penetrate exterior walls and saturate the interior. Unfortunately, this power approach to in-building coverage often causes interference to other calls in the network. Such interference occurs because direct and reflected RF signals from the high-power site reduce the signal-to-interference ratio in cells which use the same frequencies. As a result, system capacity is limited and call quality lowered.

MicroFill, on the other hand, is designed to counter co-channel interference, thereby allowing system operators to provide the higher quality of service today's cellular customers demand. MicroFill uses state-of-the-art amplifiers, 75 ohm coaxial cable and specially designed antennas to distribute precisely controlled RF signals throughout the desired area. The result is clear, clean communications with little or no interference to co-channel cells.

Cost Savings As Much As 75% With No Performance Loss.

The MicroFill system uses a 75 ohm coaxial cable distribution system. In many buildings, 75 ohm cables have been pre-installed for use with CATV and LANs. With 75 ohm cable, a cost savings of up to 75 percent over current 50 ohm cables of equal electrical specifications is possible. Since the amplifiers and the antennas are designed for 75 ohm impedance, no electrical performance is sacrificed.

By utilizing a distributed gain/radiation system, only the required amount of signal is radiated at various locations inside a structure to provide coverage. Buildings with no coverage can be provided with cellular service easily and cost effectively. Buildings already served by high-powered sites can continue to be served while power and interference are reduced.

In high-use environments, such as downtown office buildings, network capacity can be increased by "off loading" in-building users to a MicroFill system served by a dedicated cell. In conjunction with

Decibel's MicroLite™ Fiber Optic Microcell System, the dedicated cell can serve several buildings.

MicroFill Handles TDMA, CDMA And Narrow Band As Well As Analog.

The MicroFill system is designed to be transparent to the cell site. This ensures that the investment in Decibel equipment will continue to perform even if you change MTSO or base station suppliers. High linearity throughout the system ensures compatibility with TDMA, CDMA and N-AMPS as well as analog systems. This linear design supports both today's analog systems and tomorrow's digital modulation scheme.

MicroFill Installs Easily and Economically At Many Convenient Locations.

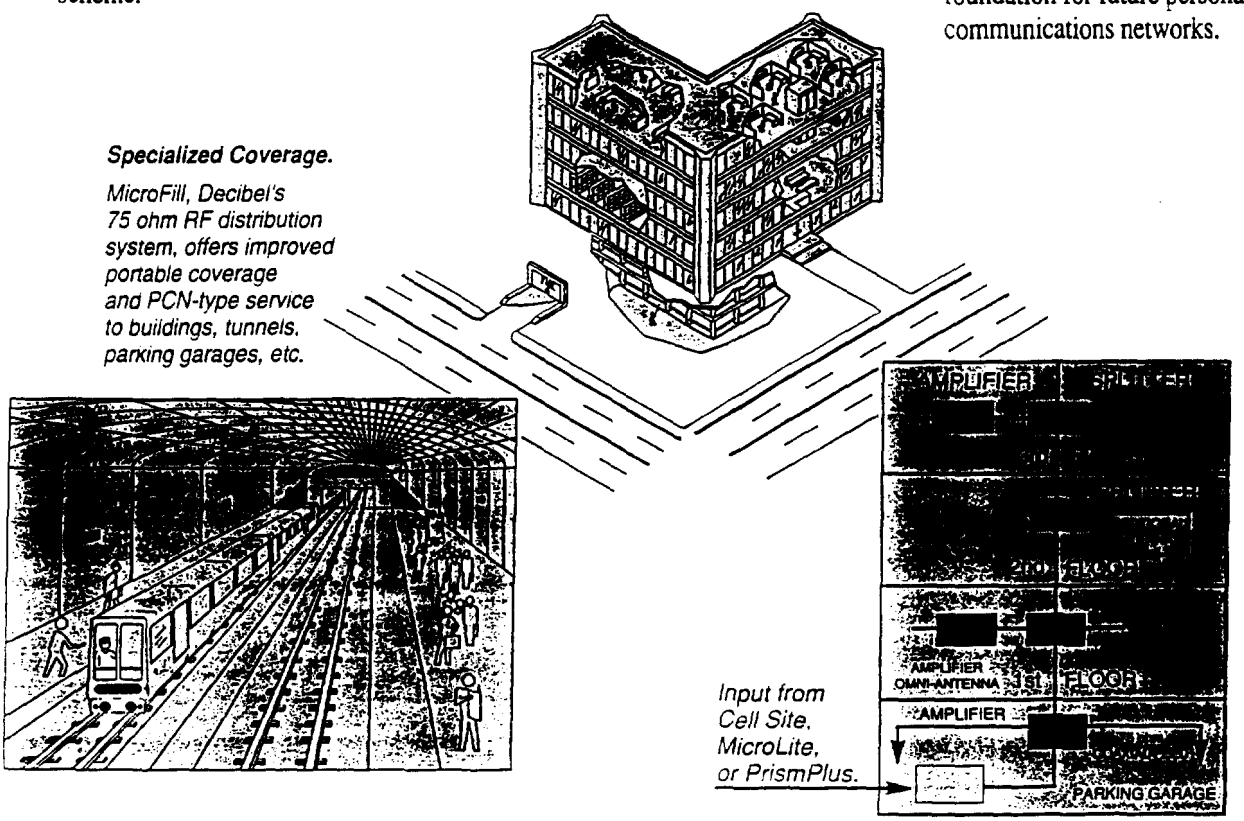
MicroFill's 75 ohm cables are designed for in-building distribution and are therefore easy to install. DC power is supplied to the in-line amplifiers through the coaxial cable. This further reduces the cost of installation, since in most cases an electrician is not required. The power source supplying the amplifiers is placed in an equipment closet and plugged into a standard electrical outlet. Uplink and downlink directional couplers provide easy setup and maintenance, as well as monitoring points in the system.

Omni and directional antennas are available to equalize coverage and signal strength. The antenna radomes are designed to be as inconspicuous as possible, looking no more objectionable than a smoke detector.

MicroFill is a member of Decibel Products' Multi Media Microcell Systems family. It is designed to work with other products including MicroLite, a fiber optic microcell system, the 16-Channel DB4416 Power Combiner, PrismPlus repeaters and a selection of specialized low-profile interior and exterior antennas. Together, these products provide cellular system engineers with the tools to meet the challenges of today's subscribers while building the foundation for future personal communications networks.

Specialized Coverage.

MicroFill, Decibel's 75 ohm RF distribution system, offers improved portable coverage and PCN-type service to buildings, tunnels, parking garages, etc.



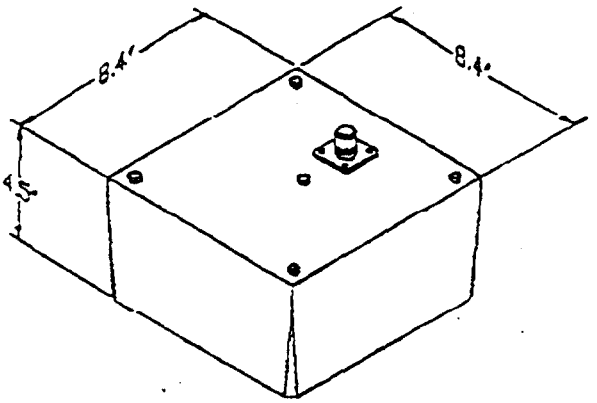
Input from Cell Site, MicroLite, or PrismPlus.

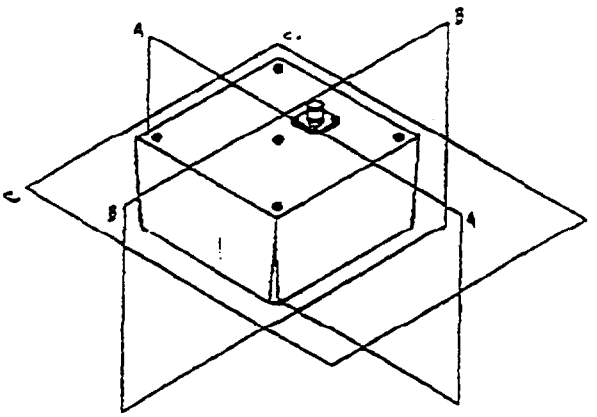
DECIBEL PRODUCTS

Micro Fill Indoor Antenna

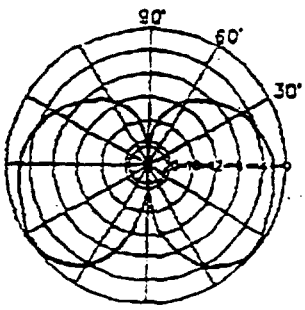
DB781S50N-C, DB781S75F-C

Model Number	DB781S50N-C	DB781S75F-C
Impedance	50 ohms	75 ohms
Termination	Type N-Female	Type F-Female
Frequency Range	824-894 MHz	
Gain	1.0 dBd or 3.1 dBi	
VSWR	≤1.5:1	
Pattern Characteristic	"Butterfly" pattern with freespace null directly below antenna	
Polarization	Perpendicular to C-C plane	
Max. Input Power	50 Watts	
Other Information	Application: Indoor Tx/Rx	
Weight	1.7 lbs	
Material	Back Panel: Brass Radiating Elements: Brass Radome: ABS Plastic	
Color	Off-White	
Mounting	Four mounting holes in backplate.	
Packing Size	12" x 12" x 12"	
Shipping Weight	2.7 lbs	

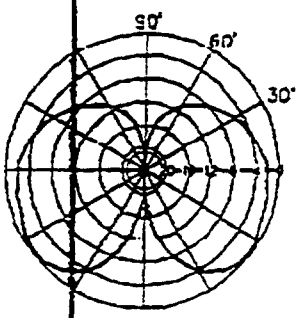


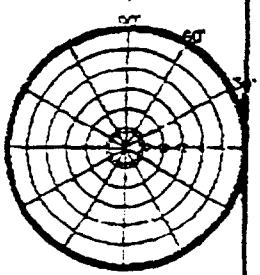


Plane A-A



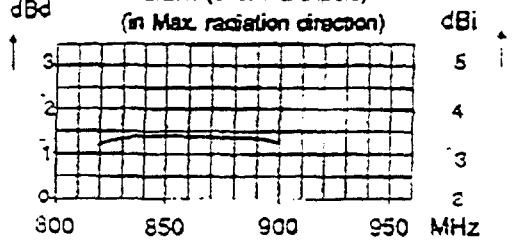
Plane B-B





Plane C-C

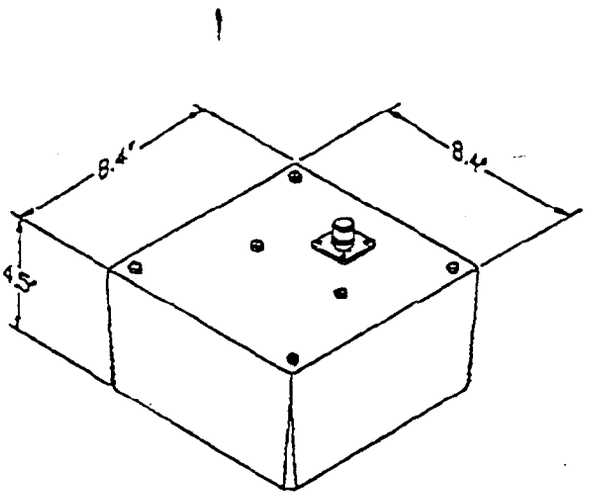
Gain (over λ/2-Dipole)
(in Max. radiation direction)

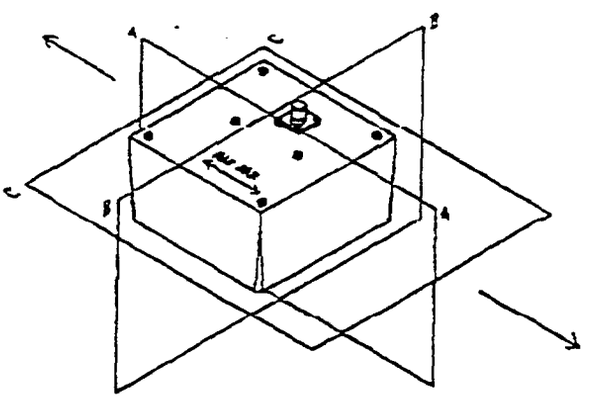


DECIBEL PRODUCTS

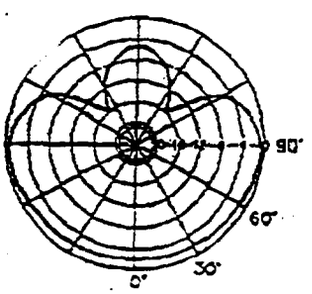
Micro Fill Indoor Antenna
DB781D50N-C, DB781D75F-C

Model Number	DB781D50N-C	DB781D75F-C
Impedance	50 ohms	75 ohms
Termination	Type N-Female	Type F-Female
Frequency Range	824-894 MHz	
Gain	> 4.0 dBd or >6.1 dBi Max in A-A and C-C plane	
VSWR	<1.5:1	
Beamwidth (3 dB from max)	225° A-A plane N.A. B-B plane N.A. C-C plane	
Polarization	Perpendicular to C-C plane	
Max. Input Power	50 Watts	
Other Information	Application: Indoor TX/Rx	
Weight	2.2 lbs	
Material	Back Panel: Brass Radiating Elements: Brass Radome: ABS Plastic	
Color	Off-White	
Mounting	Four mounting holes in backplate.	
Packing Size	12" x 12" x 12"	
Shipping Weight	3.2 lbs	

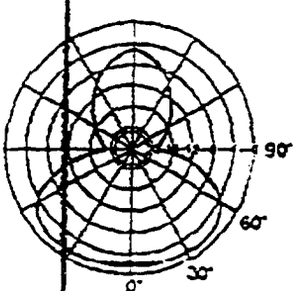


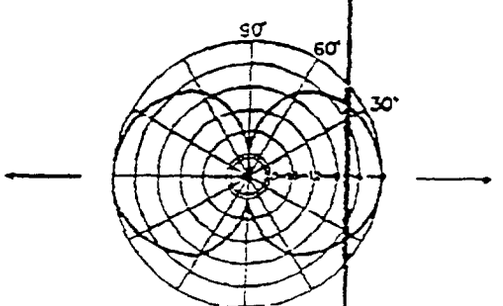


Plane A-A



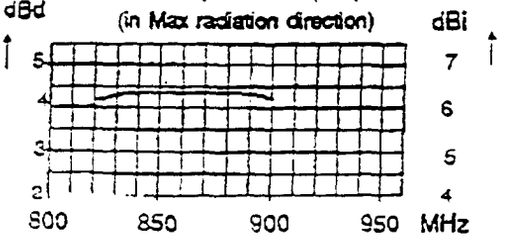
Plane B-B





Plane C-C

Gain (over λ/2-Dipole)
(in Max radiation direction)

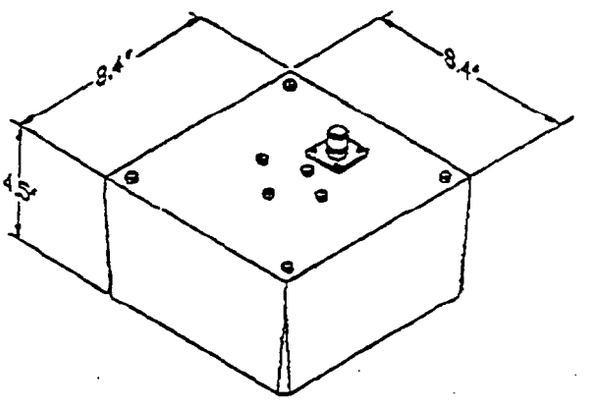


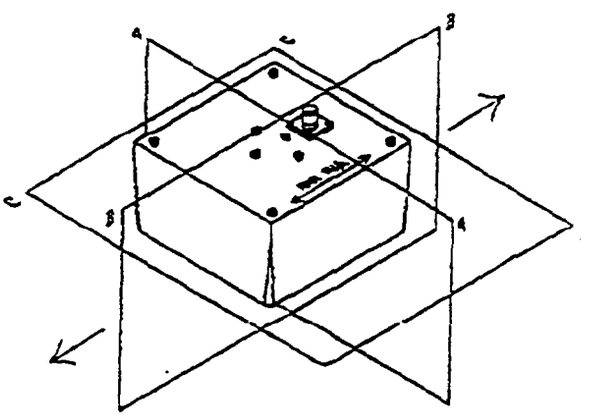
DECIBEL PRODUCTS

Micro Fill Indoor Antenna

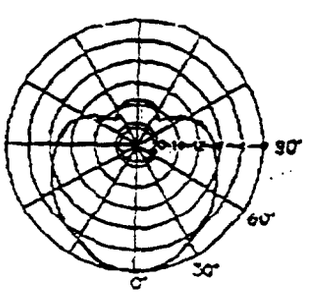
DB781LP50N-C, DB781LP50F-C

Model Number	DB781LP50N-C	DB781LP50F-C
Impedance	50 ohms	75 ohms
Termination	Type N-Female	Type F-Female
Frequency Range	824-894 MHz	
Gain	> 6.5 dBd or >8.6 dBi	
VSWR	≤1.5:1	
Beamwidth (3 dB from max)	70° A-A plane 90° B-B plane 65° C-C plane	
Polarization	Perpendicular to C-C plane	
Max. Input Power	50 Watts	
Other Information	Application: Indoor Tx/Rx >10 dB F/B ratio	
Weight	1.7 lbs	
Material	Back Panel: Brass Radiating Elements: Brass Radome: ABS Plastic	
Color	Off-White	
Mounting	Four mounting holes in backplate.	
Packing Size	12" x 12" x 12"	
Shipping Weight	2.7 lbs	

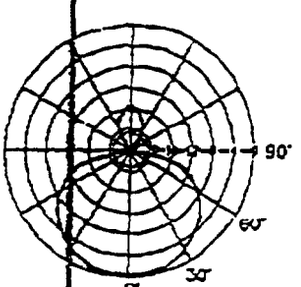


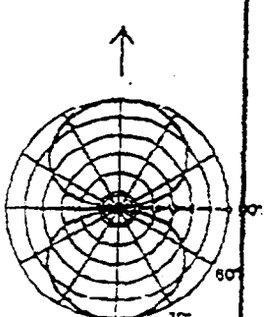


Plane B-B



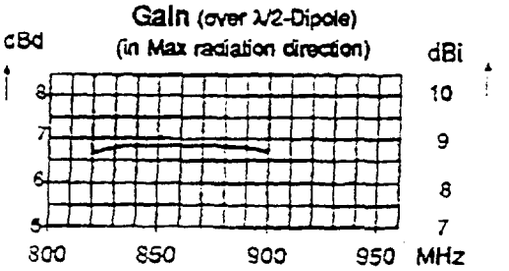
Plane A-A





Plane C-C

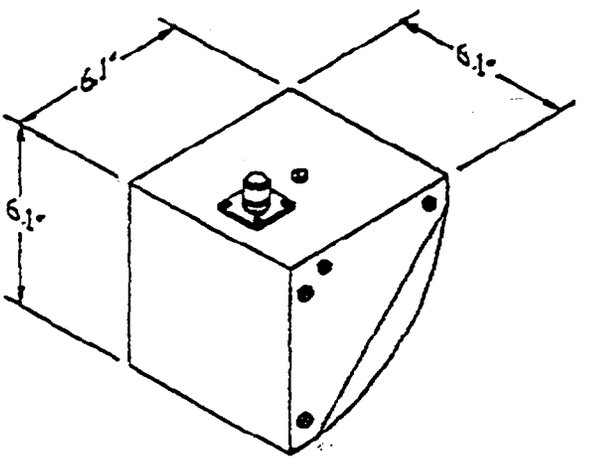
Gain (over λ/2-Dipole)
(in Max radiation direction)

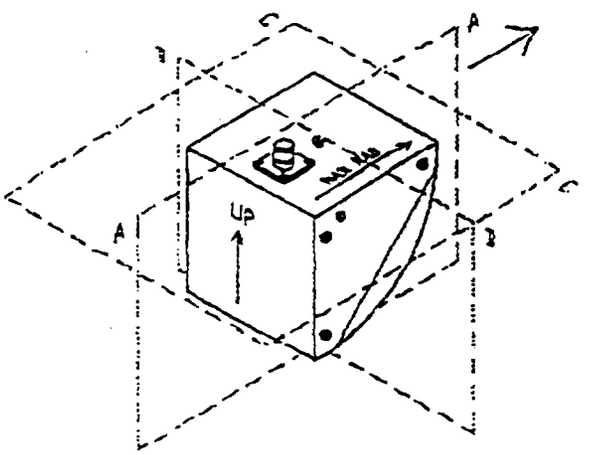


DECIBEL PRODUCTS

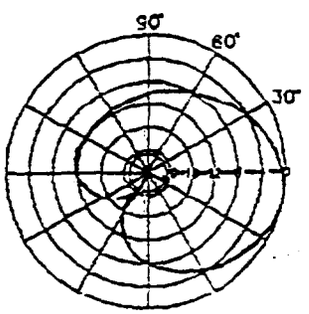
Micro Fill Indoor Antenna
DB791S50N-C, DB791S75F-C

Model Number	DB791S50N-C	DB791F75F-C
Impedance	50 ohms	75 ohms
Termination	Type N-Female	Type F-Female
Frequency Range	824-894 MHz	
Gain	>6.0 dBd or >8.1 dBi	
VSWR	<1.5:1	
Beamwidth (3 dB from max)	80° A-A Plane 120° B-B Plane 105° C-C Plane	
Polarization	Perpendicular to C-C plane	
Max. Input Power	50 Watts	
Other Information	Application: Indoor Corner Tx/Rx with >10 dB Front to Back Ratio	
Weight	1.4 lbs	
Material	Back Panel: Brass Radiating Elements: Brass Radome: ABS Plastic	
Color	Off-White	
Mounting	Four mounting holes in backplate.	
Packing Size	12" x 12" x 12"	
Shipping Weight	2.4 lbs	

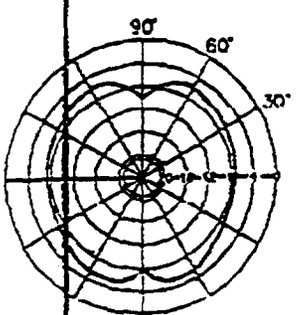


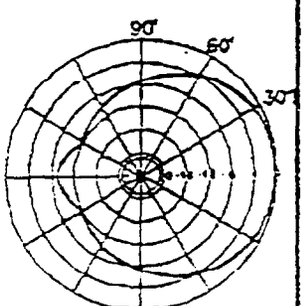


Plane A-A



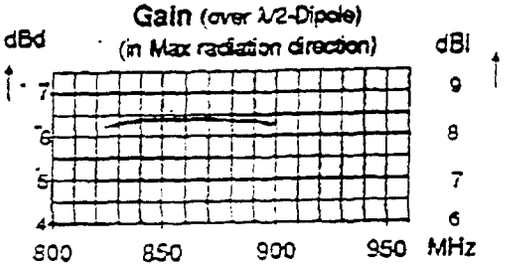
Plane B-B



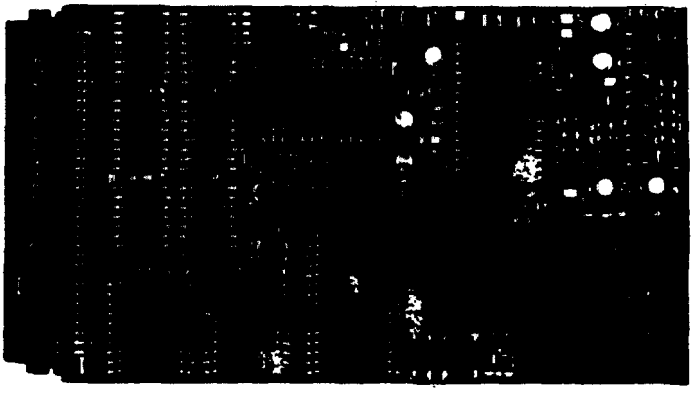


Plane C-C

Gain (over λ/2-Dipole)
(in Max radiation direction)



PCMCIA "Pager Card" Prototype
(Forerunner of PCMCIA Transceiver Card)



Physical Characteristics

Card Type:	PCMCIA Type II
Interface:	PCMCIA Memory Card or I/O
Antenna:	• Flush mount (battery could be incorporated into external handle; AAA preferred, AA probably too large) • Some manufacturers may require custom design and location. • Contact platform manufacturers on EMI and RFE compatability. This is consistent with other PCMCIA card product manufacturers.
Switch:	Power On-Off
Indicator:	Blinking LED • Message waiting indicator • Low battery indicator when voltage drops to design unit
Display:	None
Lable:	PCMCIA STU release/paragraph 3.1.7 lable
